| Semester  | 2  |
| Course <sup>*1</sup>  | Major  |
| Paper Code  | C1MT230211T  |
| Paper Title   | Vector Algebra and Geometry  |
| No. of Credits <sup>*2</sup>                                      | 4  |
| Theory / Practical / Composite                                    | Theory   |
| Minimum No. of preparatory hours per week a student has to devote | 4  |
| Number of Modules   | 2  |
| Syllabus  | <p><b>Module-1 [ Vector Algebra]</b></p> <p><b>Vector algebra &amp; its applications [16 classes]:</b><br/> Free and localized vectors, Resultant of two or more co-initial free vectors, Parallelogram law of vector addition; method of resolution [2], linear dependence and independence of vectors and related problems [2], Recapitulation of dot and cross product of two vectors [2], Scalar and Vector triple product, connection of scalar triple product with Cramer's rule of solving system of linear equations, Coplanarity and non-coplanarity of vectors from the viewpoint of scalar triple product. Problems on product of three vectors [5], Volume of a tetrahedron, Moment of a force about a point and that about a line, Resultant of a finite number of forces acting on a rigid body (emphasis on problem solving) [5]</p> <p><b>Module-2 [Geometry]</b></p> <p><b>Two- dimensional Geometry [16 classes]:</b><br/> Affine transformation of co-ordinates in a plane-rotations and translations. Commutativity of two translations and of two rotations in a plane, non-commutativity of a rotation and a translation in a plane [3], Invariants under affine transformations-(a) distance b/w two points (b) area of a triangle (c) angle between two straight lines in a plane.[2]<br/> General second-degree equation in two variables and curves represented by it-non-degenerate and degenerate conic, central and non-central conic: problems on find center when it exists [3]. Reduction of general second- degree equation in two variables to the canonical form by the method of</p> |

|                                  |   |
|----------------------------------|---|
|                                  | <p>invariants. Identification of the nature of curves represented [4].</p> <p>Tangent and normal to a non-degenerate conic (given in Cartesian and polar form) (emphasis on problem solving) [4]</p> <p><b>Three- dimensional Geometry [20 classes]:</b></p> <p><u>Sphere [8]:</u> Sphere as a surface generated by revolving a semicircle about its bounding diameter-General form of the equation of a sphere passing through three non-collinear points.[3] Tangent plane to a sphere: condition of tangency [2] . Intersection of two spheres: radical plane and circle of intersection. Equation of any sphere passing through the circle of intersection of two given spheres. [3]</p> <p><u>Cone &amp; Cylinder [9]:</u> Cone &amp; Cylinder as surfaces generated by a variable straight line satisfying some conditions: guiding curve and generator -general equation of a cone &amp; cylinder [2]. Right circular cone and right circular cylinder as special types [2]. Necessary and sufficient condition for a homogeneous second-degree equation in three variables representing a cone with vertex at the origin (statement only). Necessary and sufficient condition for such a cone to have three mutually perpendicular generators (statement only) Illustrative examples [2]. General form of the equation of the tangent plane to a cone &amp; a cylinder (no derivation): (emphasis on problem solving) [3]</p> <p><u>Conicoid: [3]</u> Familiarity with the standard equation of conicoids like ellipsoid, paraboloid and hyperboloids and their geometrical shapes.</p> |
| Learning Outcomes * <sup>3</sup> | <p>On successful completion of the course a student will be able to do the following:</p> <ul style="list-style-type: none"> <li>• Understand the concepts of localized and free vectors.</li> <li>• Get acquainted with basic vector operations and laws governing them.</li> <li>• Understand algebraic definitions of dot and cross products and their geometric interpretations.</li> <li>• Application of dot and/ or cross product to determine angle between vectors, orientation of axes, areas of triangles and parallelograms in space, scalar and vector projections, and volume of parallelepipeds.</li> <li>• Understand scalar and vector triple product and its applications.</li> <li>• Getting introduced to affine transformation of co-ordinates in rotations and translations.</li> </ul>   |

|  |  |  |
|--|--|--|
|  | <ul style="list-style-type: none"> <li>• Getting introduced to general equation of second degree in two variables and the conics represented by it.</li> <li>• Learn to reduce the general equation of second degree to the canonical form by the method of invariants.</li> <li>• Understanding sphere as a surface generated by revolving a semicircle about its bounding diameter and the general form of the equation of a sphere passing through three non-collinear points; tangent plane to a sphere; intersection of two spheres; radical plane and the circle of intersection.</li> <li>• Understanding cone &amp; cylinder as surfaces generated by a variable straight line satisfying some conditions: guiding curve and generators and right circular cone and right circular cylinder as special types.</li> <li>• Getting introduced to some familiar conicoids.</li> </ul> |  |
| Reading/Reference Lists *4               | <ul style="list-style-type: none"> <li>• S.L Loney: The elements of coordinate geometry.</li> <li>• Shanti Narayan, P.K. Mittal: Vector Algebra.</li> <li>• L. Silberstein: Elements of Vector Algebra.</li> <li>• Ghosh &amp; Maity: Vector Analysis.</li> <li>• Vladimir Lepetic: Classical Vector Algebra.</li> <li>• R.M.Khan: Analytical Geometry of two and three dimensions and Vector Analysis.</li> <li>• Robert J.T.Bell: An Elementary Treatise on Co-ordinate Geometry of three dimensions.</li> <li>• Chakraborty and Ghosh: Advanced Analytical Geometry.</li> <li>•</li> </ul>  |  |
