

**Course: M.Sc (Physics)**

Semester	4
Paper Number	17 (MPHC4403)
Paper Title	Galaxies and Particle Astrophysics
No. of Credits	6
Course description/objective	<p><b><u>Group A:</u></b></p> <p>The aim is also to enable a student to visualize the geometric structure of space-time represented by a black hole solution of Einstein's equation and the trajectories of photons in such space-times. It also aims to teach the students that accretion is one of the most important energy generation mechanisms.</p> <p>This course aims to educate the students about some major components of the universe like the galaxies and interstellar medium, about their classification and the physical principles involved in their formation and evolution.</p> <p><b><u>Group B:</u></b></p> <p>In this part of the course, the students are taught canonical quantization of the real scalar field, the complex scalar field, the electromagnetic field and the Dirac field. They are also introduced to the concept of spontaneous symmetry breaking and the generation of mass by the Higgs' mechanism</p> <p>The Objective of this course is to learn about the history and evolution of the idea of using cosmic rays as astrophysical probes. To this ends the course takes the students through possible scenarios of cosmic ray generation, acceleration, interaction with terrestrial atmosphere and their detection methods. It also provides an introduction to candidate dark matter objects and experiment along with a brief description of gravitational wave phenomena.</p>
Course Outcome	<p><b><u>Group A</u></b></p> <p><b><u>Compact Objects:</u></b></p> <p>CO1: To understand the basic mechanisms involved in the formation of compact objects like neutron stars, black holes, x-ray sources, pulsars, etc.</p> <p>CO2: To gather an in-depth knowledge about the mechanism of gravitational collapse leading to the formation of black holes, and the significance of trapped surfaces and horizons.</p> <p>CO3: To apply this knowledge to understand the coordinate transformations used to handle a singularity and the corresponding change in the nature of light cones, so as to understand the global properties and causal structure of space-times.</p> <p>CO4: To learn about the structure and evolution of white dwarfs and neutron stars so as to analyze the conditions of stability of white dwarfs and study the parameters associated with neutron star binaries.</p> <p><b><u>Interstellar Medium and Galaxies:</u></b></p> <p>CO1: Understand the birth and collapse of stars in the interstellar medium</p> <p>CO2: Appreciate that the physical laws that can be applied to the ISM can be extended to intergalactic medium and galaxies</p> <p>CO3: Learn and appreciate galaxies and their evolution as a major component of the structures of the universe.</p> <p><b><u>Group B</u></b></p> <p><b><u>Standard Model:</u></b></p>

	<p>CO1: After completing this course, the students should be able to quantize the scalar fields, the electromagnetic field and the Dirac field, canonically. CO2: They should also have obtained a basic understanding of spontaneous symmetry breaking.</p> <p><b><u>Astroparticle Physics:</u></b> CO1: Develop skill in relativistic dynamics using examples from the physics of interaction of cosmic rays with particles in IGM / Terrestrial atmosphere. CO2: Learn about the operating principles of Cosmic ray detectors and how they extend and contribute to multi-messenger astronomy CO3: Understand the implications of massive neutrino states CO4: Learn about particle candidates of Dark matter</p>

Syllabus	<p><b><u>Group A:</u></b></p> <p><b>Compact Objects, Interstellar Medium &amp; Galaxies</b> <span style="float: right;"><b>[36 Lectures]</b></span></p> <p><b>Compact Objects</b> <span style="float: right;"><b>[24 lectures]</b></span></p> <p>Black holes and compact objects. White Dwarfs and Neutron Stars, Compact X-Ray Sources, Radio Pulsars, Supermassive and other Black Holes, Gamma-Ray Bursters. <span style="float: right;">[4 lectures]</span></p> <p>Collapse of stars and formation of black holes; singularities and trapped surfaces, event horizon; Schwarzschild Black Hole, Tortoise Coordinates and Null Cones, The Kruskal Extension, Penrose Diagram – the Conformal Structure of Infinity. Kerr Black Hole; Boyer–Lindquist Coordinates, ergosphere; Weyl–Papapetrou form of the Kerr Metric, uniqueness of the Kerr solution. Dark Energy stars. Black hole accretion and accretion disk properties. <span style="float: right;">[10 lectures]</span></p> <p>White Dwarfs and Classification. Equation of State below the Neutron Drip Density, Structure of White Dwarfs and the Chandrasekhar Mass, Polytropic Approximation, Relativistic Instability of White Dwarf Stars, Necessary Condition for Stability, Total Energy in the Post-Newtonian Limit, GR White Dwarf Instability. <span style="float: right;">[5 lectures]</span></p> <p>Structure of a Neutron Star, Equations of State beyond Neutron Drip, From Neutron Drip to Saturation, Nuclear EoS for Dense Neutron Matter. Structure of Massive Neutron Stars. Periastron Shift, Shapiro Time Delay in a Binary System. <span style="float: right;">[5 lectures]</span></p> <p><b>Interstellar Medium and Galaxies</b> <span style="float: right;"><b>[12 lectures]</b></span></p> <p>Interstellar medium and star formation: Interstellar dust and gas, formation of proto-stars, pre-main sequence evolution, initial mass function <span style="float: right;">[5 lectures]</span></p> <p>Galaxies: The Milky Way, Distribution of stars, Morphology, Kinematics, Neutral hydrogen(HI 21cm line)---Dark matter, Galactic Center, Normal galaxies: morphological classification, physical characteristics and kinematics, Intergalactic Medium.</p>
----------	--

	<p style="text-align: right;">[7 lectures]</p> <p><b>Group B:</b></p> <p><b>Standard Model and Astroparticle Physics</b> <span style="float: right;"><b>[36 Lectures]</b></span></p> <p><b>Standard Model</b> <span style="float: right;"><b>[24 Lectures]</b></span></p> <p>Standard Model of Particle Interactions, Classical Field theory: Noether's Theorem and applications. [4 lectures]</p> <p>Quantum Field Theory: Quantization of the Klein-Gordon, Dirac and Electromagnetic Field. [10 lectures]</p> <p>Gauge theories of electromagnetic and weak interactions. <span style="float: right;">[6 lectures]</span></p> <p>Spontaneous Symmetry breaking and elementary idea about the Higgs' mechanism. <span style="float: right;">[4 lectures]</span></p> <p><b>Astroparticle Physics</b> <span style="float: right;"><b>[12 Lectures]</b></span></p> <p>Astroparticle physics in perspective: Relationship to High Energy Physics, Astrophysics and Cosmology. Elementary particle processes in galactic, intergalactic and atmospheric production and transmissions, Physics of particle and radiation detection. <span style="float: right;">[4 lectures]</span></p> <p>Acceleration mechanisms in sunspots, supernovae shocks and accreting binaries. <span style="float: right;">[4 lectures]</span></p> <p>Primary and secondary cosmic rays: Charged and uncharged components: neutrino, gamma, x-ray and gravitational wave astronomy. Secondary cosmic rays: Atmospheric propagation, cosmic rays at the sea level and underground, Extensive air showers (elementary theory). <span style="float: right;">[4 lectures]</span></p>
